I honestly didn't expect to see that many people on my site. I knew my site was not optimized for mobile, so my first spamming of messages was through email and then myself texting those that I emailed to please go to my site for this project. I ended up with an interesting result. People still kept logging in with their phones because I forgot about the mail app on your mobile device so some pulled this up on their phones. I eventually text people the link and then that's when mobile started to go up but I also noticed some desktop users go up at the same time after this (you can see the spike on the 3rd of april). I think the desktops occurred because of the fact that everyone I text has a mac and was probably already on their mac so then they just clicked on the link. Nothing special came of the globe data except for one user in New Zealand because I sent it to my roommate who was there visiting his dad over the semester.
